

Nocturnal enuresis means uncontrolled urination during sleep at night.
This problem usually faced by the childrenâ€™s form age 2 to 15
This disease is related with lack of sensation of urination to child at night, day time they must be comfortable.
School going child above age 8 to age15, are the most trouble sum child, parents are always worried about them especially if it is female child.
In other paths there is no significant treatment is available, some time the problems is ignored because it s recovery will be age related, but which is not a comfortable answer for this worry.
I have formulated the Ayurvedic combination which can be safely given to child.
Within 6 months treatment we can see very good results that the control of bladder is significantly increase s
8 months treatment can completely recover the child or nocturnal bed wetting can Â stopped permanently.
